Ginger for Chemotherapy-induced nausea and vomiting?

a systematic literature review and meta-analysis

Megan Crichton

What's the issue?

- Fatigue
- Loss of appetite
- Weight loss
- **Nausea + vomiting**
- Decreased QoL
- Depression
- Anxiety
- GI symptoms

- ↓ QoL
- ↓ oral intake
- Malnutrition
- Treatment cessation
- Mortality

Evidence for Ginger for CINV

Ginger (*Zingiber officinale*) and chemotherapy-induced nausea and vomiting: a systematic literature review

Wolfgang M Marx, Laisa Teleni, Alexandra L McCarthy, Luis Vitetta, Dan McKavanagh, Damien Thomson, and Elisabeth Isenring

N=7 studies
Qualitative analysis
Mixed support for use of
ginger

Ginger as an Antiemetic Modality for Chemotherapy-Induced Nausea and Vomiting: A Systematic Review and Meta-Analysis

Jiyeon Lee, RN, PhD, ACNP-BC, and Heeyoung Oh, RN, PhD

N=5 studies
Meta-analysis
No significant effect of
ginger

Standard recommendations for use of ginger for CINV in the
clinical setting **not warranted.**

Study Aim

To evaluate the **efficacy**
of **ginger**
supplementation in the
prevention and
management of
CINV.

Method

- ➔ 5 electronic databases searched
- ➔ From database inception to April 2018
- ➔ Data pooled (meta-analysis)
- ➔ Study quality assessed (Cochrane ROB Tool)
- ➔ Quality of body of evidence evaluated (GRADE)

Method – Study Characteristics

Included

- Any language
- Age >18 years
- Chemotherapy patients
- Intervention of ginger
- Comparator of placebo or standard care alone

Excluded

- Radiation
- Unable to be translated to English
- Receiving other interventions as comparator

Results – Search

Records identified through

Results – Study Samples

Total No. participants	1652
Sample sizes	20-375
Female	64%
Country	Iran (n=6 studies), Thailand (n=4), USA (n=2), Turkey (n=2), Italy, Indonesia, China, Australia (n=1)
Cancer	Breast (n=9), lung (n=2), ovarian (n=2), other (gastrointestinal, haematological, unspecified) (n=5)
CTx type	Platinum-based (n=8); anthracycline-based (n=6); unspecified (n=4)
CTx emetogenicity	Moderate and/or high (n=8); unspecified (n=10)
CTx regimen	Single-day (n=6); unspecified (n=12)
Anti-emetics	Corticosteroid + 5-HT ₃ receptor antagonist (n=6); Corticosteroid + 5-HT ₃ receptor antagonist + other (n=7); aprepitant + 5-HT ₃ receptor antagonist (n=2); unspecified (n=3)

Results – Nausea Incidence

>1g/day for any duration significantly reduced odds of overall nausea incidence by 42%.

GRADE level: very low

Any dose for >3-days duration significantly reduced odds of overall nausea incidence by 27%.

GRADE level: very low

Results – Vomiting Incidence

≤1g/day for any duration significantly reduced odds of overall vomiting incidence by 30%.
GRADE level: low

Any dose for >3-days duration significantly reduced odds of overall nausea by 40%.
GRADE level: low

Limitations

- Clinical heterogeneity
- Missing Data
- Small sample size in some studies
- Limited confidence in estimated effect

Take Home Message

Ginger supplementation for **>3-days** may **improve** CINV.

Existing research around **dosage** remains **inconsistent**.

...more research!
