Australian Army recruit training course length and recruit injury rates

1 Dawson, G., 2 Broad, R. & 1 Orr, R.

1 Bond University
2 Physiotherapy Department, KMA
Aims and Hypothesis

• The longer the training period, the greater the risk of injury?

Aims:

Investigate the influence of lengthening training courses on injury rates
– Profile injuries that occur.
Participants

- Participants:
  - Australian Regular Army recruits attending Basic Recruit training at Kapooka
  - Recruits were randomly selected for each course

Methods

• Data recorded during two different Army recruit training courses over 1 year period (2013)
  ARC (80 d) / ASC (100 d)

• Injury Prevalence
  Number of reported injuries / number of personnel completing respective course x 100

• Injury Incidence
  Number of injuries / number of recruits completing the respective course / course length in days
Results

- **ASC:**
  - 73 recruits, nil excluded
  - 13 recruits injured (17.8%)
    - 38.5% females

- **ARC:**
  - 194 recruits, 23 excluded
  - 27 recruits injured (13.9%)
    - 33% females

- **Injury prevalence:**
  - ASC: 17.8 per cent
  - ARC: 13.9 per cent

- **Injury incidence:**
  - ASC: 17.8 / 100 soldiers / 100 days
  - ARC: 17.4 / 100 soldiers / 100 days
Anatomical sites of injury

- Collectively the highest anatomical injury sites:
  - Ankle/foot: 20 per cent (n=8)
  - Back/torso: 12.5 per cent (n=5)
  - Lower leg: 12.5 per cent (n=5).

ASC:
  - Back/torso: 30.7 per cent
  - Ankle/foot 15.4 per cent
  - Shoulder 15.4 per cent

ARC:
  - Ankle/foot 22.2 per cent
  - Lower leg 14.8 per cent
• ASC had notably higher prevalence of injuries compared to ARC
• However when looking at cohort size and exposure to training, both courses had similar incidence rates

In contrast to previous studies, the current study revealed much lower prevalence and incidence rates

  - 233 male Greek army recruits, 7 week course
  - 28.3% prevalence

  - 480 Marine Corp officers, 6 week course
  - 60.7% incidence
  - 3.9 injuries per 1,000 person hours of physical training
Discussion

• Most common anatomical sites of injuries:
  – Current study:
    • Sprains and strains
    • Stress fractures
  – These injury types were also found to be the most common type in studies conducted by Havenetidis et al and O’Connor et al.
While the ASC had a higher prevalence of injury when injuries took into account exposure, incidence rates were virtually identical when considering the ASC against the ARC recruits are no more likely to be injured on one course over the other. When investigating injuries based on time periods, exposure to the risk needs to be taken into account.
